LINEN & WORKWEAR

CLEAN & SAFE LINEN

During the COVID-19 pandemic CLEAN's top priority is to produce and deliver the safest and highest quality linen for our customers and their guests.

Disinfection during washing

During washing the linen and towelling is both thermally and chemically disinfected. We exceed UK regulations by holding the **71°C** threshold temperature for more than the standard **3 minutes** to completely ensure that the linen is safe and fit for purpose. The result is a hygienically clean product that we then rinse until pH neutral to avoid causing any skin irritation.

After washing

All bed linen is ironed dry at **190°C** and towelling is dried at **90-100°C** for **15+ minutes**. Linen is swab tested to validate thermal disinfection, as part of our improved quality control system. All stock is then packed in shrink wrapped plastic to maintain hygiene levels.

Delivery and collection

Our team of professional drivers will retain the full **2m social distancing**, both at customer sites and at our laundries to reduce risk of transmission. Sterilisation of laundry cages, vehicle interiors and loading areas takes place before any clean linen is loaded.

Protecting our employees and your linen

On arrival each employee is temperature checked and questioned to establish that they are fit for work. When working, all colleagues wear suitable **PPE**. The laundry layout and machines have been adapted to ensure social distancing and to keep everyone safe, in line with Government guidance.

Quality is always our highest priority; increased visual inspection and strict quality control rejects defective pieces with accuracy and precision.
